

# @angular/universal - SSR

## 9. Dynamic loading of components and modules

# dynamic loading

- usually we load component and directives by placing their selectors in the template.
- Usually we add module by placing them in the **imports** array of a module
- With dynamic loading you can load those elements in you code.
- This will allow you to load modules only in one platform by branching with PLATFORM\_ID
- it's recommended to go with shimming and use this as last resort
- The loaded elements can be lazy loaded

# EX.

/academeez

- Let's try and load a module in a dynamic lazy fashion.
- That module will contain a component
- our job will be to display that component

# Thank You
